

Enhance the Patient and Guest Experience with Systems Manager for Healthcare

THE BENEFITS OF MOBILITY IN HEALTHCARE

Mobile devices play an increasingly large role in healthcare, enabling everything from self-service kiosks registration to devices used to access patient health records and information. With access to information at their fingertips, clinicians can view patient records, medical history, write prescriptions, send referrals, and so much more. Meraki Systems Manager, Cisco's EMM solution, makes deploying, securing, and managing these devices, their application, and data, simple and easy, so you can get back to the business of caring for patients.

IMPROVING EFFICIENCY AND QUALITY OF CARE

Systems Manager, powered by Meraki's Cloud Dashboard, allows you to quickly and easily deploy devices across any number of locations. When devices work seamlessly, patient care improves. Medical staff can give a more personalized experience, and care can happen faster when information can be securely accessed, and shared, from anywhere.

With the acceleration of mobility in healthcare, it's important to be able to quickly scale deployments, and get devices up and running quickly. Meraki Systems Manager has tools built for this, like zero or low touch provisioning, over the air management and troubleshooting, and custom API integrations.

SECURING DEVICES, APPLICATIONS, AND DATA

Meraki Systems Manager can be used to lock down access to devices, applications, and data to help meet compliance mandates such as HIPAA. Encrypt device data and traffic to allow caregivers to access information from anywhere, quickly and securely. Dynamic policies based on time, location, and posture further secure access to applications and information.
